

How to Protect Your Family

- 1. Never hold the phone directly against your head or body**
When speaking on a cell phone use speakerphone, or wired earpieces, or hands-free devices, or air-tube earpieces.
- 2. When it's on, don't carry a cell phone close to the body**
Examples: don't carry a cell phone in your pocket, don't tuck a cell phone into your bra. Even when you're not using your cell phone, it emits radiation while it's on.
- 3. Beware of weak signal**
When signal strength is weak or blocked, your phone works harder and emits higher radiation. Use a corded landline more often.
- 4. Keep it away from children**
Children will absorb at least twice as much microwave radiation as adults. Pregnant women should keep cell phones away from their abdomens.
- 5. Don't sleep with your cell phone nearby**
You go to sleep but your cell phone doesn't. It always emits radiation while it's on. Don't put your phone under your pillow, don't put it on a bedside table, don't put it near anyone who is sleeping.

Doctors' Advice to Patients & Their Families

Cell Phones & Health: Simple Precautions Make Sense

This pamphlet reviews precautionary advice by governments to reduce your exposure to cell phone radiation.

**ENVIRONMENTAL
HEALTH TRUST**

Cell phones are two-way microwave radios that were never properly tested for safety.

Antennas for cell phones are continually searching for signals from towers to send and receive information. The body or brain absorbs about half the radiation emitted from a phone at any time.

Children absorb more radiation than adults

People who use cell phones more than 30 minutes per day (average) for 10 years have a doubled or higher risk of brain cancer. Teenagers who start to use cell phones develop 4 to 5 times more brain cancer in less than a decade. Links to studies can be found at EHTrust.org.

WORLD HEALTH ORGANIZATION (2011)

On May 31, 2011, the World Health Organization/International Agency for Research on Cancer classified the electromagnetic radiation from cell phones as possibly carcinogenic to humans based on an increased risk for glioma, a malignant type of brain cancer, associated with use of mobile phones.

Can Cell Phones Cause Cancer and Disease?

A number of well-designed studies indicate that cell phone use increases cancer risk. Cell phones change the brain. After 50 minutes of holding a cell phone on or next to the ear, the brain of a healthy adult shows significant changes in glucose metabolism—the brain’s fuel—at precisely those areas reached by cell phone radiation. The long-term impact of these changes is unknown. Recent research suggests that cell phones, cordless phones, and other wireless devices can also disturb heart rate.

Cell Phones Lower Sperm Count

Men who use cell phones 2 to 4 hours per day have 30% lower sperm count than non-users; daily use over 4 hours results in 40% lower sperm count. Studies have shown that microwave radiation can damage sperm.

Agarwal, *Fertility and Sterility*, 2008

HEALTH CANADA (2011)

“Health Canada reminds cell phone users that they can take practical measures to reduce RF exposure. The department also encourages parents to reduce their children’s RF exposure from cell phones since children are typically more sensitive to a variety of environmental agents.”
