PRACTICE SAFE TECH

Use and carry wireless gear away from your head and body.

Wireless connections (in use or on standby) are radiation that the World Health Organization says is a possible cause of human cancer.

Beware of weak network signals. Gear works harder and emits more radiation when the signal is weak.

Before bedtime power off all wireless devices and networks. #PracticeSafeTech

Most of them constantly emit radiation, including when no one is using.

Power off more often. Each wireless-enabled device doses every person in the connection/coverage area with radiation:

each component and any size of wireless gear/accessories/appliances, baby monitors, cordless phones, etc.

For voice/data/entertainment prefer corded landlines and wireline connections. Also cordless phones, WiFi routers, and wireless game and entertainment base stations all emit radiation. Choose, provide and request wireline options so everyone can #PracticeSafeTech.

Say no to tech while moving [driving, walking, biking, blading, skiing, etc.]. Distraction for a second can be the difference between life and death. #PracticeSafeTech
