## The Scientific Evidence To Support Restrictions on Cell Towers On Or Near School Property

November 13, 2023

Dear Williamson County Board of Commissioners:

Today, we are writing to advise you of the scientific grounds for enacting strong school policy to mitigate student, teacher and staff exposures to the non-ionizing electromagnetic field emissions from cell towers. Wireless radio frequency (RF) electromagnetic (EMF) radiation and magnetic field/extremely low-frequency electromagnetic fields (ELF-EMF) are a relatively new and rapidly increasing environmental exposure in classrooms today. Significant sources include cell towers, cell boosters and 5G/4G networks on and near school property.

Extensive published scientific evidence indicates that radiofrequency radiation at levels compliant with federal government limits can cause <u>cancer</u>, <u>increased oxidative stress</u>, <u>genetic damage</u>, structural and functional changes of the <u>reproductive system</u>, <u>memory deficits</u>, <u>behavioral problems</u>, and <u>neurological impacts</u>. We consider radiofrequency radiation (RFR) to be a human carcinogen based on the <u>current body</u> of evidence. Many of these effects could be irreversible with grave consequences for our children's future.

We recommend policies to reduce human exposure to RF, especially in schools. We note that schools are now taking measures to reduce cell tower radiation from nearby cell towers. As an example, the Desert Sage High School in central Tucson, a public charter school has <u>installed shielding along the wall facing the cell tower</u> to reduce the cell tower radiation exposures in the classroom.

On August 13, 2021, the United States Court of Appeals for the District of Columbia Circuit <u>ruled in our</u> <u>case</u> against the FCC that the decision by the Federal Communications Commission (FCC) not to update it's 1996 safety limits for human exposure to wireless radiation (which includes cell tower emissions) was "arbitrary and capricious." One of the most important aspects of the court decision was that the court found the FCC did not adequately explain why it ignored scientific evidence on impacts from long term wireless radiation exposure, especially in regards to children, who the American Academy of Pediatrics states are more vulnerable to wireless radiation. The court ordered the FCC to examine the record evidence regarding long term exposure to children. So far, the FCC has not responded. Thus, this landmark <u>ruling</u> highlights how no federal health agency has reviewed the full body of current research to ensure current safety standards are protective.

As an example of the research indicating federal regulations are inadequate to protect health, refer to a publication titled <u>"Evidence for a health risk by RF on humans living around mobile phone base stations:</u> <u>From radiofrequency sickness to cancer</u> by Balmori (2022). This publication reviewed the existing scientific literature on cell tower radiation and found associations with radiofrequency sickness, cancer and changes in biochemical parameters. We have attached this study for your review. A review paper by <u>Pearce 2020</u> titled "<u>Limiting liability with positioning to minimize negative health effects</u> <u>of cellular phone towers</u>" reviewed the "large and growing body of evidence that human exposure to RFR from cellular phone base stations causes negative health effects." The authors recommend restricting antennas near homes and within 500 meters of schools and hospitals to protect companies from future liability.

Studies on people living near cell antennas have found increases in molecular markers in the blood that predict cancer. Zothansiama et al, 2017 evaluated effects in the human blood of individuals living near mobile phone base stations (for study purposes, they chose a distance of 80 meters) compared with healthy controls living more than 300 meters from a base station. The study measured higher RFR levels in the homes of people living in homes within 80 meters from the cell antennas (documenting the impact of increased RFR radiation from the antenna installations) and found statistically significant differences in their blood. The group living closer to the antennas had statistically significant higher frequency of micronuclei and a rise in lipid peroxidation in their blood; these changes are considered biomarkers predictive of cancer.

Please note the following scientific publications regarding cell towers and cell phone radiation:

- In 2011, radiofrequency radiation was <u>classified</u> as a Class 2B possible carcinogen by the World Health Organization's International Agency for Research on Cancer. Between then and now, the published peer-reviewed scientific evidence has significantly increased. Now, many scientists are of the opinion that the weight of current peer-reviewed evidence supports the conclusion that radiofrequency radiation should be regarded as a human carcinogen (<u>Hardell and Carlberg 2017</u>, <u>Peleg et al. 2018, Miller et al 2018</u>).
- The U.S. National Toxicology Program \$25 million animal study on long-term exposure to
  radiofrequency radiation found <u>DNA Damage, heart damage</u>, increased <u>brain tumors, and
  increased heart tumors</u> deemed "clear evidence of cancer." Researchers with the renowned
  Ramazzini Institute in Italy then published <u>findings</u> that lab animals exposed to levels of RFR
  comparable to cell tower base stations' networks developed the same types of cancers as the <u>US
  National Toxicology Program</u> found in its large-scale animal study.
- An Australian <u>study</u> looked at RFR levels to which kindergarten children were exposed, depending on how close their school was to base stations/cell towers. Researchers equipped the children with RFR measuring devices. Researchers found that kindergartens located nearby base stations/cell towers (closer than 300 meters or approximately 330 yards) had total exposure to radiofrequency radiation (RFR or RF-EMF) more than 3 times higher than children at schools where base stations were further away than 300 meters.
- A review by <u>Yakymenko 2015</u> found that in 93 out of 100 studies, RFR exposure caused oxidative stress. Many well-known carcinogens (such as asbestos and arsenic) are understood to induce oxidative stress. <u>Schuermann et al., 2021</u> again confirmed non-ionizing radiation has oxidative effects in the majority of animal and cell studies.
- The International Association of Firefighters has officially opposed cell towers on their stations since 2004 after a study <u>found</u> neurological damage in firefighters with antennas on their fire station. In 2017, when 5G "small cells" were coming to California via a 5G streamlining bill (SB 649), firefighter organizations came out in strong opposition to the bill and requested that towers

not be installed on firehouses. They were successful and SB649 was<u>amended</u> to <u>exempt</u> their stations from the deployment due to their health concerns.

- A study by <u>Meo et al., 2019</u> of students in schools near cell towers found their higher RF exposure was associated with impacts on motor skills, memory, and attention. Examples of other health issues associated with cell towers in research studies include <u>neuropsychiatric problems</u>, diabetes, <u>headaches</u>, <u>sleep problems</u>, and <u>genetic damage</u>. Such research continues to accumulate after the 2010 landmark <u>review study</u> on 56 studies that reported biological effects found at very low intensities of wireless radiation, including impacts on reproduction, permeability of the blood-brain barrier, behavior, cellular changes and metabolic changes, and increases in cancer risk (<u>Lai and Levitt 2010</u>).
- The International EMF Scientist Appeal was submitted to the United Nations urging immediate protective policy action in light of the scientific evidence that has found adverse biological effects from electromagnetic radiation, including radiofrequency radiation, and, as of July 2023, this Appeal is signed by 259 scientists from 44 nations; these are scientists who have published peer-reviewed articles about electromagnetic fields. They state, "numerous recent scientific publications have shown that EMF affects living organisms at levels well below most international and national guidelines. Effects include increased cancer risk, cellular stress, increase in harmful free radicals, genetic damages, structural and functional changes of the reproductive system, learning and memory deficits, neurological disorders, and negative impacts on general well-being."
- The European Parliament Study Service "<u>Health Impact of 5G</u>" report concludes that the electromagnetic field emission frequencies of 450 to 6,000 MHz "are probably carcinogenic for humans, in particular related to gliomas and acoustic neuromas" and in regards to reproductive developmental effects "these frequencies clearly affect male fertility and possibly female fertility too. They may have possible adverse effects on the development of embryos, fetuses and newborns."

The exposure limits of the U.S. are outdated and do not protect the health of the public, especially not the health of children and staff exposed every school day. This is why the <u>New Hampshire State</u> <u>Commission on 5G</u> and <u>Santa Clara Medical Association</u> recommend restricting cell towers near schools.

Please note that in several countries, governments have set policies to protect children, pregnant women and medically fragile persons by classifying areas with homes, hospitals and schools as "sensitive areas." These countries reduce exposure in "sensitive" areas and have strict oversight and compliance measures in place.

Our position is that children require special protections from radiofrequency radiation and their exposures should be reduced to as low as possible. Teachers and staff should work in a healthy environment. We strongly recommend mitigating RFR exposure at schools.

EHT has been joined by other experts and organizations in writing to you and offering expertise to support the development of protective measures. Please see the attached resources with additional documentation. We are available to meet and present more about how to reduce and mitigate RF risks and answer any questions.

Thank you for your consideration and action on this important issue.

## Signatories

Devra Davis, PhD, MPH President and Founder, Environmental Health Trust

Anthony B. Miller, MD Professor Emeritus at the Dalla Lana School of Public Health, University of Toronto Senior Advisor to Environmental Health Trust

Keywords: Base station Cell tower Health Mast RF radiation Microwave syndrome Radar Radio antennas

### ABSTRACT

The objective of this work was to perform a complete review of the existing scientific literature to update the knowledge on the effects of base station antennas on humans. Studies performed in real urban conditions, with mobile phone base stations situated close to apartments, were selected. Overall results of this review show three types of effects by base station antennas on the health of people: radiofrequency sickness (RS), cancer (C) and changes in biochemical parameters (CBP). Considering all the studies reviewed globally (n = 38), 73.6% (28/38) showed effects: 73.9% (17/23) for radiofrequency sickness, 76.9% (10/13) for cancer and 75.0% (6/8) for changes in biochemical parameters. Furthermore, studies that did not meet the strict conditions to be included in this review provided important supplementary evidence. The existence of similar effects from studies smart meters and laboratory studies, reinforce the conclusions of this review. Of special importance are the studies performed on animals or trees near base station antennas that cannot be aware of their proximity and to which psychosomatic effects can never be attributed.

### 1. Introduction

During the last few decades, hundreds of thousands of mobile phone base stations and other types of wireless communications antennas have been installed around the world, in cities and in nature, including protected natural areas, in addition to pre-existing antennas (television, radio broadcasting, radar, etc.). Only the aesthetic aspects or urban regulations have been generally considered in this deployment, while the biological, environmental and health impacts of the associated nonionizing electromagnetic radiation emissions have not been assessed so far. Therefore, the effects on humans living around these anthropogenic electromagnetic field sources (antennas) have not been considered.

In France, there is a significant contribution of mobile phone base stations in the exposure to radiofrequency electromagnetic fields (RF-EMF) of urban citizens living nearby (De Giudici et al., 2021). Some studies from India indicate that more than 15% of people have levels of EMF strength above 12 V/m due to their proximity to antennas (Premlal and Eldhose, 2017). Exposure estimates have shown that RF-EMF from mobile telephone systems is stronger in urban than in rural areas. For instance, in Sweden the levels of RF radiation have increased considerably in recent years, both outdoor and indoor, due to new

telecommunication technologies, and the median power density measured for RF fields between 30 MHz and 3 GHz was 16  $\mu$ W/m<sup>2</sup> in rural areas, 270  $\mu$ W/m<sup>2</sup> in urban areas and 2400  $\mu$ W/m<sup>2</sup> in city areas (Hardell et al., 2018). Total exposure varies not only between urban and rural areas but also, depending on residential characteristics, between different floors of a building, with a tendency for building exposure to increase at higher floors (Breckenkamp et al., 2012).

Over the past five decades, and more intensively since the beginning of this century, many studies and several reviews have been published on the effects of anthropogenic electromagnetic radiation on humans living around the antennas. The first studies were carried out with radio and television antennas, investigating increases in cancer and leukaemia (Milham, 1988; Maskarinec et al., 1994; Hocking et al., 1996; Dolk et al., 1997a, 1997b; Michelozzi et al., 1998; Altpeter et al., 2000), as well as around radars (Kolodynski and Kolodynska, 1996; Goldsmith, 1997).

Regarding base station antennas, there are scientific discrepancies in their effects: some studies concluded that there are no health-related effects (e.g. Augner and Hacker, 2009; Blettner et al., 2009; Röösli et al., 2010; Baliatsas et al., 2016) whereas others found increases in cancer and other health problems in humans living around antennas (e. g. Santini et al., 2002; Navarro et al., 2003; Bortkiewicz et al., 2004;

<sup>&</sup>lt;sup>1</sup> Independent researcher

Eger et al., 2004; Wolf and Wolf, 2004; Abdel-Rassoul et al., 2007; Khurana et al., 2010; Dode et al., 2011; Shinjyo and Shinjyo, 2014; Gandhi et al., 2015; López et al., 2021; Rodrigues et al., 2021). There is a specific symptomatology linked to radar and RF exposure at low levels, characterized by functional disturbances of the central nervous system (headache, sleep disturbance, discomfort, irritability, depression, memory loss, dizziness, fatigue, nausea, appetite loss, difficulty in concentration, dizziness, etc.), that has been termed 'RF sickness' (Lilienfeld et al., 1978; Johnson Lyakouris, 1998; Navarro et al., 2003).

The objective of this study was to perform a complete review of the existing scientific literature to update the knowledge on the effects of base stations on humans living around the antennas.

### 2. Methods

A search was performed in the EMF portal, Google Scholar and PubMed databases with the words: "mobile phone base station and health" or "cell tower and health".

Only studies performed in real urban conditions, with mobile phone base stations situated close to apartments, were selected. Studies conducted in larger regions with numerous antennas, based on surveys and geographic data, were also included.

On the contrary, studies were excluded that considered different sources of electromagnetic radiation, such as mobile phone base stations together with broadcast transmitters (TV and radio), radar, mobile phones, cordless phones, Wi-Fi or wireless smart meters. Also excluded were those that included antennas and powerlines jointly. Studies that only performed measurements or modelling of radiation levels in the environment of the antennas or in the body, but did not deal with health effects, were excluded, as were surveys on risk perception and the nocebo effect, modelled radiofrequency electromagnetic field exposure from mobile-phone base stations or perceived exposure. All experimental laboratory studies, experiments in an exposure chamber or adapted room were also excluded. Finally, the comments or criticism of previously published studies were also excluded. However, due to their importance the conclusions of some of the excluded studies will be discussed in the corresponding section.

### 3. Results

The studies that met the selected criteria are presented in chronological order in Table 1, catalogued as Y/N depending on whether or not they found effects. The selected studies cover three types of effects: radiofrequency sickness (RS) (according to Lilienfeld et al., 1978; Johnson Lyakouris, 1998), cancer (C) and changes in biochemical parameters (CBP). Table 1 also includes the authors, year and country, antenna type, study design, diseases and symptoms found/not found and the main conclusions of each study.

Considering all the selected studies (n = 38), 73.6% (28/38) showed effects: 73.9% (17/23) for radiofrequency sickness, 76.9% (10/13) for cancer and 75.0% (6/8) for changes in biochemical parameters (Fig. 1). Therefore, most of the studies carried by research groups from twenty different countries reach the same conclusions.

For the reasons previously explained, the following studies (n = 85) were not considered in this review, even though the conclusions of some of these studies will be discussed later due to their importance regarding the similarities of the electromagnetic radiation types involved and the health effects found in many cases. Several studies only performed measurements or modelling of radiation levels in the environment of the antennas or in the body, but did not deal with the effects on health (e.g. Aniołczyk, 1999; Henderson and Bangay, 2006; Keow and Radiman, 2006; Neitzke et al., 2007; Bürgi et al., 2008; Augner et al., 2009; Chen and Chuang, 2009; Schmiedel et al., 2009; Viel et al., 2009; Hansson et al., 2011; Alhekail et al., 2012; Breckenkamp et al., 2012; Beekhuizen et al., 2013; Bürgi et al., 2014; Lyare et al., 2019; Urbinello et al., 2014; Lemaire et al., 2016; Admawi, 2021; De Giudici et al., 2021; Kazaure

et al., 2021; Yetis and Kavili, 2021). Some were surveys on risk perception and the nocebo effect, modelled RF-EMF exposure from mobile-phone base stations or perceived exposure (Wiedemann et al., 2006; Dohle et al., 2012; Kowall et al., 2012; Freudenstein et al., 2015; Dieudonné, 2016; Klaps et al., 2016; Martens et al., 2017; Koh et al., 2020). Others jointly considered various sources of electromagnetic fields such as telephone antennas, mobile phones, cordless phones, Wi-Fi, powerlines or wireless smart meters (Seitz et al., 2005; Baliatsas et al., 2011; Atzmon et al., 2012; Eskander et al., 2012; Frei et al., 2012; Lamech, 2014; Singh and Pati, 2016; Boehmert et al., 2020; Akkam et al., 2020). Some studied the effects of radio or television antennas (Milham, 1988; Maskarinec et al., 1994; Hocking et al., 1996; Dolk et al., 1997a, 1997b; McKenzie et al., 1998; Michelozzi et al., 1998; Altpeter et al., 2000; Hocking and Gordon, 2000; Boscolo et al., 2001; Cooper et al., 2001; Michelozzi et al., 2002; Hallberg and Johansson, 2002; Elwood, 2003; Ha et al., 2003; Park et al., 2004; Abelin et al., 2005; Altpeter et al., 2006; Ha et al., 2007; Satta et al., 2018). Others were radar studies (Kolodynski and Kolodynska, 1996; Goldsmith, 1997; Szmigielski et al., 2001; Yakymenko et al., 2011; Schoeni et al., 2016; Martens et al., 2018). Some studies performed experiments in a laboratory, exposure chamber or adapted room, with simulated or real electromagnetic radiation from base station antennas (e.g. Zwamborn et al., 2003; Hinrichs et al., 2005; Regel et al., 2006, 2007; Eltiti et al., 2007; Leitgeb et al., 2008; Riddervold et al., 2008; Augner et al., 2009; Augner et al., 2010; Wallace et al., 2010; Danker-Hopfe et al., 2010; Falcioni et al., 2018; Azimzadeh and Jelodar, 2019; Smith-Roe et al., 2020). Some reports were comments or criticisms of previously published studies (e.g. Coggon, 2006; Röösli and Huss, 2008; Bithell, 2010; Dode and Leão, 2012; Foster and Trottier, 2012; Mortazavi, 2014, 2017).

### 4. Discussion

The results of this review show three types of effects by base station antennas on the health of humans: radiofrequency sickness, cancer and changes in biochemical parameters (Fig. 1). From among all these studies, most of them found effects (73.6%). Thus, despite some limitations and differences in study design, statistical measures, risk estimates and exposure categories (Khurana et al., 2010), together they provide a consistent view of the effects on the health of people living in the vicinity of base station antennas.

Studies conducted in large regions with numerous antennas, based on surveys and geographic data (e.g. Augner and Hacker, 2009; Dode et al., 2011; Baliatsas et al., 2016; Martens et al., 2017; Dode et al. al., 2021), have the limitation that there may be many factors other than the base station antennas affecting the health of the population (environmental and occupational determinants of diseases and symptoms, individual characteristics such as food and life habits, activity level, smoking, self-medication, individual pathologies or genetic factors) that can act as confounding factors. It is important to mention here that the meters used for power density measurements in research papers should have more high quality equipment and better measurement methods.

On the other hand, some studies did not meet the strict conditions to be considered in this review, but due to their importance regarding the similarities of the electromagnetic radiation types involved and the effects found in many cases, they provide important supplementary evidence, as we will see in the next paragraphs.

For example, mobile phone users had an increased risk of headache (one of the typical symptoms for RF sickness near base station antennas) compared with non-users, and the risk of headache was also increased in those who had a longer daily call duration and higher daily call frequency (Wang et al., 2017). The same was also seen with cancer (Hardell et al., 2007). On the other hand, the symptoms caused by wireless smart meters were similar to those reported by people exposed to RF fields emitted by mobile phones (Lamech, 2014).

The study found<br>no association between mobile phone<br>base stations and risk of cáncer.  | In this systematic national<br>investigation the authors found no<br>association between risk of cancer in<br>young children and estimated<br>exposures to radiofrequency from<br>mobile phone base stations during<br>pregnancy. However there is a<br>research paper limitation on page 5:<br>"our models did not include<br>information on other sources of<br>radiofrequency exposure, such as from<br>microcells or picocells" and the city<br>centers (especially) are full of these<br>kind of antennas. |
| 13<br>Y<br>RS<br>C  | Khurana et al.<br>(2010)<br>international | Base station<br>antennas  | Review of previous publications   | Effects found on:<br>Adverse neurobehavioral symptoms or<br>cancer   | The authors identified a total of 10<br>epidemiological studies that assessed<br>for putative health effects of mobile<br>pone base stations. Seven of these<br>studies explored the association<br>between base station proximity and<br>neurobehavioral effects and three<br>investigated cancer. The authors found<br>that eight of the 10 studies reported<br>increased prevalence of adverse<br>neurobehavioral symptoms or cancer<br>in populations living at distances                                   |
| 14<br>N<br>RS       | Röösli et al. (2010)<br>Switzerland       | Base station<br>antennas (GMS 900<br>and 1800 and<br>UMTS 2170) | Systematic review   | There are no adverse effects   | <500 m from base stations.<br>Not indication of an association<br>between any health outcome and RF-<br>EMF exposure from mobile phone bas<br>stations at levels typically found in ou<br>everyday environment. There is also<br>no evidence that EHS individuals are<br>more susceptible to base station<br>radiation than the rest of the<br>population. The evidence for the<br>absence of long-term effects is limited  |
| 15<br>N<br>CBP<br>C | Yildirim et al.<br>(2010)<br>Turkey       | Base station<br>antennas  | Blood samples to analise the<br>micronucleus (MN) frequency and<br>chromosomal aberrations on blood in<br>people living around mobile phone<br>base stations and healthy controls.  | There was not a significant difference of<br>MN frequency and chromosomal<br>aberrations between the two study<br>groups.  | Mobile phones and their base stations<br>do not produce important<br>carcinogenic changes.  |
| 16<br>Y<br>RS       | Alazawi, 2011<br>Iran                     | 8 Base station<br>antennas                                      | Questionnaire survey on 375 subjects.<br>Not measurements   | Effects found on:<br>-headaches<br>-sleep disturbances<br>-irritability<br>-depressive<br>-tendencies<br>-feeling of discomfort,<br>-difficulties in concentration<br>-memory loss<br>-lowering of libido  | This study shows that inhabitants<br>living nearby mobile phone base<br>stations are at risk for developing nor<br>specific health symptoms, the facing<br>position appears to be the worst one<br>for distances from cellular phone base<br>stations <100 m.<br>It is advisable that cellular phone base<br>stations should not be sited closer than<br>300 m to populations, as a<br>precautionary measure, sitting of base<br>stations should be such as to minimize<br>exposure of neighbors.               |
| 17<br>Y<br>C        | Dode et al. (2011)<br>Brazil              | Base station<br>antennas  | This research was conducted in a<br>broad environmental context, aiming<br>to verify if there is a spatial<br>correlation between the Base station<br>antennas and the cases of death by<br>neoplasia during the period between<br>1996 and 2006 in Belo Horizonte  | The mortality rates and the relative risk<br>were higher for the residents inside a<br>radius of 500 m from the Base station<br>antennas, compared to the average<br>mortality rate of the entire city, and a<br>decreased dose– response gradient was<br>observed for residents who lived farther | The research showed the existence of spatial correlation between cases of death by neoplasia and the locations of the Base station antennas, in the Belo Horizonte municipality from 1996 to 2006.  |

|---------------|---|---|---|--|--|
| 8<br>Y<br>C   | Li et al. (2012)<br>Taiwan                    | Base station<br>antennas                                  | Population-based case–control study<br>in Taiwan considerering incident<br>cases aged 15 years or less and<br>admitted in 2003–2007 for all<br>neoplasm (n = 3481 children).<br>Exposure of each study subject to<br>radio frequency (RF) was indicated by<br>the averaged annual power density<br>within 5 years prior to the neoplasm<br>diagnosis. Controls were randomly<br>selected. | Taiwanese children with higher-than<br>median exposure of RF potentially<br>emitted from Base station antennas<br>were at significantly increased risk of all<br>neoplasms combined. Although there<br>were also positive associations between<br>RF power density and risks of brain<br>neoplasm and leukaemia in children,<br>such associations did not reach<br>statistical significance.   | This study noted a significantly<br>increased risk of all neoplasms in<br>children with higher-than-median RF<br>exposure to Base station antennas. The<br>slightly elevated risk was seen for<br>leukaemia and brain neoplasm, but<br>was not statistically significant.  |
| 9<br>N<br>C   | Stewart et al.<br>(2012)<br>Great Britain     | 1 Base station<br>antennas (GMS<br>1800)                  | Data on cancer incidence and<br>mortality accessing the medical<br>information of near residents  | The study cannot conclude that the base<br>station is responsible for the incidence<br>of cancer in the local residents  | Although the age range for local<br>residents with cancer in the suspected<br>cluster was younger than might be<br>generally expected, there was no<br>evidence that their cancer incidence is<br>associated with the mobile phone base<br>station. 10 cancers were registered<br>after installation of the base station.<br>However, the collection of cancers<br>does not fulfil the criteria for a cancer<br>cluster; the cases are a mixed variety o<br>relatively common cancers. No single<br>type of cancer was dominant, all but<br>one were common types of cancer and<br>none were seen in a group not usually<br>affected by that cancer. Data from<br>primary and secondary care also<br>provide evidence that lifestyle and<br>family history factors could have<br>contributed to some individual cases. |
| 20<br>N<br>RS | Islam and<br>Mohammed<br>(2014)<br>Bangladesh | Base station<br>antennas                                  | Questionnaire survey on 220 adults<br>living near a Base station antenna for<br>at least one year in two selected areas   | Half of the respondents experienced<br>problems in sleeping patterns, recent<br>episodes of headache or dizziness and<br>mood change, anxiety, or depression.<br>11 respondents experienced some<br>generalized burning sensation and 4<br>reported episodes of shaking or fits. 48<br>respondents mentioned one or more<br>other health effects, such as mood<br>changes/problem, buzzing in the head,<br>hopelessness, palpitation, tachycardia,<br>heaviness of chest, anorexia, diarrhoea,<br>and skin diseases. | From the results of the study cannot<br>conclude that the health effects are<br>direct results of the base station<br>antennas. However, the complaints<br>were similar to those of other studies,<br>which shows the importance of<br>conducting further research to<br>determine the effects of<br>electromagnetic radiarion from base<br>station antennas on human health and<br>should be considered as a public health<br>concern.  |
| 21<br>Y<br>RS | Pachuau and<br>Pachuau (2014)<br>India        | Base station<br>antennas (GSM<br>900)                     | Questionnaire survey conducted on<br>64 adults (31 female, 33 male) and<br>electric field measurements. Health<br>symptoms of RF exposure faced by the<br>inhabitants within 50 m and outside<br>50 m from the tower were analysed<br>and compared.   | Effects found on:<br>-Muscle pain<br>-Fatigue<br>-Sleep disorder<br>-Nausea<br>-Skin problema<br>-Dizziness<br>-Feeling of discomfort<br>-Difficulty in concentration<br>-Memory loss<br>-Visual disruption  | Inhabitants living within 50 m had<br>more health complaints than those<br>living outside 50 m. It was also found<br>that females had more complaints than<br>males  |
| 22<br>Y<br>RS | Shinjyo and<br>Shinjyo (2014)<br>Japan        | 2 base station<br>antennas (CDMA<br>800 MHz and 2<br>GHz) | Medical examinations and health<br>questionnaires comparing the health<br>of 107 residents during the base<br>station's operation and after its<br>removal.<br>Measurement of the power density   | - visual disruption<br>Effects found on:<br>-fatigue<br>-eye problems<br>-sleep disturbances<br>-dizziness<br>-headache<br>-tinnitus<br>-nasal bleeding<br>No effects found on:<br>-tachycardia<br>-tumours<br>-skin problems<br>-rhinitis<br>-angina pectoris<br>-hearing loss  | A total of 34 residents suffered from<br>health problems after installation of<br>the 800 MHz antennas. Three months<br>after their removal this number<br>decreased to 13. There were 41<br>residents who had health problems<br>after installation of the 2 GHz<br>antennas, and this number decreased<br>to 15 after removal of the 2 GHz<br>antennas. In total 49 residents suffered<br>from health problems during<br>operation of both the 800 MHz and the<br>2 GHz antennas. However, this<br>number decreased to 25 after remova<br>of both sets of antennas. The residents<br>had no prior knowledge about possible   |

|--------------------|--------------------------------------|--|---|--|---|--|--|
| N°                 | Reference and country                | Antenna type                               | Study design  | Diseases and symptoms found/not found  | Main conclusions  |  |  |
| 35<br>Y<br>RS      | Ali et al. (2021)<br>Iraq            | Base station<br>antennas<br>(900–1800 MHz) | Questionnaire survey comparing two<br>groups. The first group $(n = 79)$ was<br>located in a town with three cell<br>phone towers with less than a<br>hundred meters apart. The second<br>study group $(n = 79)$ was limited to<br>the area almost empty from cell<br>phone towers. Electric field<br>measurements were made.   | There was a significant association<br>between health problems (skin<br>problem, hair loss issues, sleeping<br>difficulties, and fertility issues) and<br>distance to towers (less distance, more<br>problems: P-value $< 0.05$ ). In regards to<br>health problems (abnormalities, blood<br>pressure issues, tumours cases, and<br>memory and concentration difficulties),<br>the obtained results were not<br>statistically significant. | The results showed an increase in both<br>short- and long-term health problems<br>near base stations antennas in general.   |  |  |
| 36<br>Y<br>RS<br>C | López et al., 2021<br>Spain          | 9 Base station<br>antennas                 | Questionnaire survey on 268 persons,<br>174 in exposed área and 94 in control<br>área, and EMF measurements   | Effects found on -headache<br>-dizziness<br>-instability<br>-tachycardias<br>-nightmares<br>No effects found on:<br>-fainting  | People who are exposed to higher<br>radiation values present more severe<br>headaches, dizziness and nightmares.<br>5.6% cancer cases in the study<br>population, a percentage 10 times<br>higher tan that of the total Spanish<br>population.  |  |  |
| 37<br>N<br>RS      | Martin et al.<br>(2021)<br>France    | Base station<br>antennas                   | Questionnaire survey in 354 residents<br>from buildings located at a distance of<br>250 m or less from the base station<br>antennas in the main transmit beam<br>of the antennas and home exposure<br>measurements  | No significant association between RF-<br>EMF exposure and the overall<br>symptoms score, nor between RF-EMF<br>exposure from MPBSs and insomnia-<br>like symptoms. There was a significant<br>association between RF-EMF exposure<br>and insomnia-like symptoms only for<br>participants who attributed their<br>symptoms to radiofrequencies.  | The findings of the study do not<br>support the hypothesis of an<br>association between RF-EMF exposure<br>and health outcomes, such as self-<br>reported non-specific or insomnia-like<br>symptoms in the general population.<br>However, they may suggest a possible<br>association between such exposure<br>and insomnia-like symptoms among<br>people reporting environmental<br>concerns.  |  |  |
| 38<br>Y<br>C       | Rodrigues et al.<br>(2021)<br>Brazil | Base station<br>antennas                   | This is an ecological study using<br>capitals as the unit of analysis. The<br>authors collected information on the<br>number of deaths by cancer, gender,<br>age group, gross domestic product per<br>capita, death year, and the amount of<br>exposure over a lifetime and<br>investigated all cancer types and<br>some specific types (breast, cervix,<br>lung, and esophagus cancers). | For all cancers and for the specific types<br>investigated (breast, cervix, lung, and<br>esophagus cancers), the higher the<br>exposure to RBS radiofrequency, the<br>higher the median of mortality rate.   | The results indicates that the exposure<br>to radiofrequency electromagnetic<br>fields from an RBS increases the rate of<br>mortality by all cancers and<br>specifically by breast, cervix, lung, and<br>esophageal cancers. These conclusions<br>are based on the fact that the findings<br>of the study indicate that, the higher<br>the RBS radiofrequency exposure, the<br>higher the cancer mortality rate,<br>especially for cervix cancer. The<br>spatial analysis showed that the<br>highest radiofrequency exposure was<br>observed in a city located in the<br>southern region of Brazil, which also<br>showed the highest mortality rate for<br>all types of cancer and specifically for<br>lung and breast cancers. |  |  |

### 4.1. Investigations with radar and radio/television antennas

In studies carried out in the last century, occupational exposure of people to microwave radiation (RF) related to military, industrial and radio uses, as well as radio waves, showed several types of effects: an increase in spontaneous abortions, changes in red and white blood cell counts and an increase in childhood, testicular and other cancers. These findings suggest that RF exposures are potentially carcinogenic and have other health effects; the author recommends precautionary measures to avoid unnecessary exposure (Goldsmith, 1997). An analysis of particular locations of diagnosed neoplasms indicates significantly higher morbidity rates in the military exposed to RF for alimentary tract cancers, skin tumours, neoplasms and cerebral and haematological/lymphatic malignancies. For haematological/lymphatic malignancies, the difference in morbidity between exposed and unexposed military was the largest. This may suggest that spontaneous neoplasms develop faster in the exposed group, with a shorter latency period than in those not exposed. In fact, in exposed subjects, the disease occurs 5-10 years earlier (Szmigielski et al., 2001). On the other hand, children exposed to radar electromagnetic radiation had less developed memory and attention, their reaction time was slower and their neuromuscular apparatus endurance was decreased (Kolodynski and Kolodynska, 1996).

In several studies performed around radio and television antennas, there was a significant decrease in the risk of cancer and leukaemia with increasing distance to the antennas (Maskarinec et al., 1994; Dolk et al., 1997a, 1997b; Hocking and Gordon, 2000; Michelozzi et al., 2002; Park et al., 2004). People exposed to a radio antenna shortwave broadcasting station in Schwarzenburg (Switzerland) had sleep disturbances, which were more frequent in exposed than in unexposed subjects (Altpeter et al., 2000).

Thus, the coincidences of similar effects from studies with different sources of electromagnetic radiation (but with similar pulsed, polarized and modulated radiation), such as radar or radio/television antennas, reinforce the conclusions of this review. Non-ionizing EMF are among the fastest growing forms of environmental pollution, its increase around the world in recent years has been exponential (Bandara and Carpenter, 2018) and symptoms reported today may be classic microwave/RF sickness (Levitt and Lai, 2010).

### 4.2. RF exposure incidents among diplomats (Havanna syndrome)

From late 2016 through August 2017, US government personnel on a diplomatic mission in Havana, Cuba, reported neurological symptoms, including cognitive, balance, visual and hearing disturbances, sleep

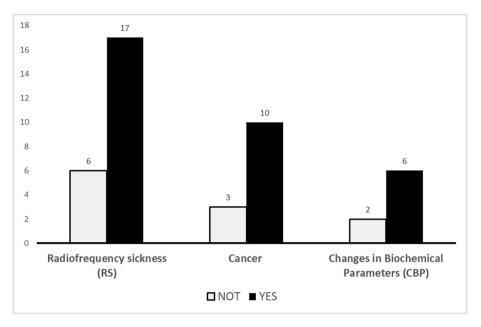

Fig. 1. Results on effects according to the study type considered.

disturbances and headaches. These individuals appeared to have sustained injuries to generalized brain networks with no associated history of head trauma (Swanson et al., 2018). They complained of cognitive decline, fatigue and headache, especially after cognitive exertion, and in some cases tinnitus, nausea and balance problems (Dyer, 2018). This mysterious disease that affected US and Canadian diplomats in Cuba (and later also in China) has confused the FBI, the State Department and US intelligence agencies.

The reported facts seem consistent with pulsed RF/microwave as the source of injuries to the affected diplomats (Golomb, 2018). The same conclusion was later reached by the National Academy of National Academies of Sciences (2020), who reported that many of the chronic or non-specific symptoms were consistent with known effects of RF, such as dizziness, headache, fatigue, nausea, anxiety, cognitive deficits and memory loss. In general, directed pulsed RF energy appears to be the most plausible mechanism to explain these cases. Such symptoms had already been described much earlier at the Moscow embassy (Lilienfeld et al., 1978; Johnson Lyakouris, 1998).

There are objective pathophysiological changes and health effects induced by EMF exposure that can biologically damage the organism and are noxious agents in healthy people (Belpomme and Irigaray, 2022).

### 4.3. Important laboratory studies

The United States National Toxicology Program (NTP) tested the two main modulation types used for mobile phones worldwide for GSM (2G) and UMTS (3G/4G), in a two-year rodent cancer bioassay under nearfield exposure conditions; the experiments included additional assays for genotoxicity endpoints (Smith-Roe et al., 2020). They found clear evidence of carcinogenic activity, and more specifically malignant schwannomas of the heart, malignant gliomas of the brain and benign, malignant or complex pheochromocytomas (combined) of the adrenal medulla. They also found increased DNA damage (measured by the comet assay) in the frontal cortex of male mice, in the leukocytes of female mice and in the hippocampus of male rats, indicating that mobile phone EMF could cause DNA damage and consequent carcinogenesis. In a similar large carcinogenicity study by the Ramazzini Institute, Falcioni et al. (2018) examined far-field exposure to GSM 1800 MHz EMF and reported very similar results to the NTP study. Specifically, they also found increased incidence of tumours of the brain and heart in the

mobile phone EMF-exposed Sprague-Dawley rats. Furthermore, these tumours are of the same histotype as those observed in some epidemiological studies on mobile phone users (Hardell et al., 2007).

Kostoff et al. (2020) emphasizes that most of the laboratory experiments conducted to date were not designed to identify the more severe adverse effects reflective of the real-life operating environment in which wireless radiation systems operate, as many experiments do not include pulsing and modulation of the carrier signal and the majority do not account for synergistic adverse effects of other toxic stimuli.

# 4.4. Importance of studies with biological parameters and those performed on animals and plants

Despite the scientific evidence shown in the studies carried out in many countries by different teams of researchers that we have reviewed, several studies conclude that no effects are found and blame it on risk perception and the nocebo effect (Wiedemann et al., 2006; Kowall et al., 2012; Freudenstein et al., 2015; Dieudonné, 2016; Klaps et al., 2016; Koh et al., 2020). However, the nocebo effect is not supported by objective data (Belpomme and Irigaray, 2022), by the results of cancer studies (Eger et al., 2004; Wolf and Wolf, 2004; Dode et al., 2011; Li et al., 2012; Rodrigues et al., 2021), by studies on changes in haematological parameters (Gandhi et al., 2015; Meo et al., 2015; Taheri et al., 2017; Zothansiama et al., 2017), by hormonal changes after long-term exposure (Eskander et al., 2012), by salivary secretion (Singh et al., 2016) and by effects on fertility (Al-Quzwini et al., 2016). Many reviews on the health effects of mobile phones have reached the same conclusions regarding their effects on male infertility (El-Hamd and Aboeldahab, 2018). Unfortunately, the studies that allude to the nocebo effect seem to be the ones taken into account by the World Health Organization (World Health Organization, 2015).

On the other hand, studies performed on animals or trees near base station antennas are especially important, because animals and plants cannot be aware of their proximity and therefore nocebo or psychosomatic effects cannot be attributed (Balmori, 2005, 2010; Balmori and Hallberg, 2007; Hässig et al., 2012; Lázaro et al., 2016; Waldmann--Selsam et al., 2016; Levitt et al., 2021). In fact, a similar result of this study for humans was found in a review on the significant ecological effects of RF EMF in 65% of the studies on vertebrates, birds and plants (Cucurachi et al., 2013).

Moreover, for these effects, perfectly plausible mechanisms of action

have already been proposed. Plasma membrane calcium channels and other voltage-gated ion channels are irregularly activated/inactivated by man-made EMF in both animals and plants, increasing intracellular  $[Ca^{2+}]$  and altering intracellular ion concentrations (Panagopoulos et al., 2002, 2021; Pall, 2016).

Under the influence of non-thermal intensities of microwave radiation, often there are important signals of some hazardous changes in cell metabolism. A significant increase of reactive oxygen species and nitrogen oxide generation in cells under non-thermal intensities has been detected both in vivo and in vitro (Yakymenko et al., 2011; Belpomme and Irigaray, 2022). Thus, the different findings clearly argue for a causal role of EMF in inducing free radical species, including overproduction of reactive oxygen and nitrogen species or suppression of antioxidant defence in cells (Belpomme and Irigaray, 2022). Furthermore, this exposure can result in DNA damage through oxidative stress with reactive oxygen species/free radical overproduction (Yakymenko et al., 2011; Kıvrak et al., 2017; Panagopoulos et al., 2021).

### 5. The Precautionary Principle

The International Commission on Non-Ionizing Radiation Protection (ICNIRP) is a private organization that issues exposure guidelines that are then adopted by governments, but it has been accused of having conflicts of interest (Hardell and Carlberg, 2020; Hardell et al., 2021). The ICNIRP (2010, 2020) limits are thousands of times above the levels where effects are recorded for both extremely low frequency and RF man-made EMF and account only for thermal effects, whereas the vast majority of recorded effects are non-thermal. These existing guidelines for public health protection only consider the effects of acute intense (thermal) exposures and do not protect from lower level long-term exposures (Israel et al., 2011; Yakymenko et al., 2011; Blank et al., 2015; Starkey, 2016; Belpomme and Irigaray, 2022). The exposure duration is crucial to assess the induced effects.

The Precautionary Principle is one of the fundamental principles of the European Union, governing policies related to the environment, health and food safety (Harremoes et al., 2013). This principle enables decision-makers to adopt precautionary measures when the scientific evidence regarding an environmental or human health factor is not certain regarding its safety. Therefore, despite the existing ample and rapidly increasing scientific evidence, no significant progress has been made over all these years, at least at the level of guidelines issued by the responsible authorities and official regulatory bodies. Some authors have pointed out that the source of funding correlates with study findings, and many systematic reviews and meta-analyses in this field have failed to correct for this source of funding bias, which has likely underestimated the evidence for causation (Carpenter, 2019). A growing number of scientists have been calling internationally on governments to raise their safety standards for RF-EMF (Blank et al., 2015; Hardell and Nyberg, 2020; Frank, 2021). Thus, there is an urgent need to adopt the Precautionary Principle and impose more restrictive levels (Zinelis, 2010; Yakymenko et al., 2011; Blank et al., 2015; Starkey, 2016).

### 6. Conclusion

In the current circumstances, it seems that the scientific experts in the field are very clear about the serious problems we are facing and have expressed this through important appeals (Blank et al., 2015; Hardell and Nyberg, 2020). However, the media, the responsible organizations (World Health Organization, 2015) and the governments are not transmitting this crucial information to the population, who remain uninformed. For these reasons, the current situation will probably end in a crisis not only for health but also for this technology itself, as it is unsustainable and harmful to the environment and the people.

### Declaration of competing interest

The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.
